Changelog yuuvis RAD 8.2

Schlüssel	Zusammenfassung	Beschreibung
TUK-980	As a user, you can double-click the csv-file of the exported hit list and German Umlauts and Emojis are correctly formatted in Excel	And as an administrator, you can configure whether the export of hit lists is in character format UTF8 or UTF8 BOM to support the user requirement.

And as an administrator, you can configure whether the export of hit lists is in character format UTF8 or UTF8 BOM to support the user requirement.

Acceptance criteria:

- If it is configured the export of hit lists is in UTF8 BOM and other encodings in the search-prod.yml, the default is UTF8:
  - In der Datei search-prod.yml kann man folgende Einstellungen für CSV Exporte vornehmen:
    csv.encoding: UTF-8   -> das ist default, other encodings are listed here: https://docs.oracle.com/javase/8/docs/technotes/guides/intl/encoding.doc.html , bu the client does not handle other encodings the UTF-8 well. This feature will come in a later version.
    csv.writeBOM: true -> Kodierung enthält zusätzlich ein BOM, Default ist false

---

TUK-1044 — As an administrator, you can easily roll out the agent with default connections

As an administrator, you can easily roll out the agent with default connections so that you reduce effort.

Acceptance criteria:

- If the file connection_distributed.json exists
  - the setup will copy this file into the folder "store": %appdata%\Roaming\yuuvis RAD agent\store
  - the agent reads the content of this file and merges the connections given in the connection.json that is stored in the same folder.
- Example file:

```
[
    {
        "id": "e714db5e-9dc0-062b-cfa5-ffcf52c2ebb96574",
        "alias": "Our default connection",
        "gatewayUrl": "http://kolibriproliant.optimal-systems.de",
        "webClientPath": "/app/client/",
        "username": "smith",
        "isConnected": true,
        "ntlm": false,
        "oauth": false,
        "selfsigned": false,
        "default": true
    }
]
```

The "id" must be unique for all connections of this user on his workstation which should be in general be the case.

"alias" is shown as the name of the connection.

In this case of "ntlm": true and "selfsigned": false, no self-signed certificates are accepted.

In this case fo "isConnected": true and "username" is given and "ntlm": false, the agent pops up the login dialog for username and password. After connecting both parameters are saved to this file.
In this case, "default": true the user can not delete this connection setting.

TUK-1050 — As a user speaking traditional Chinese (zh-Hant for traditional), Thai (th), or Vietnamese (vi), you are potentially supported by the client user interface

As a user speaking traditional Chinese (zh-Hant for traditional), Thai (th), or Vietnamese (vi), you are potentially supported by the client user interface so that date formats are correctly presented,

Acceptance criteria:

- The locales with iso code vi, th and the sub-locale zh-Hant is added to the client and can be selected. The formats for date, decimal and integer fields are working well.

| TUK-1051 | The service-manager setup supports elasticsearch parameters | As an administrator, I want the service-manager setup to ask me for the ip-address, port, and password of Elasticsearch as well as the IntraFind language that should be activated. These values should then be written to the configuration yml-files so that I don't have to manually edit the files after the setup is finished. |

Acceptance criteria

- A new dialog page "Configuration of Elasticsearch" is created in the Bitrock setup GUI
- The page contains a string field for the ip-address(s) and the port(s) of the Elasticsearch server(s) and shows an exemplary syntax for a single server and for multiple servers
- The page contains a string field for the password of the Elasticsearch "elastic" user
- The page contains a string field for the language that should be supported by the IntraFind linguistic plugin and shows an exemplary syntax for defining the language code. The description of this field also contains a link to the help page showing the supported language codes in the language of the setup (https://help. optimal-systems.com/yuuvisRAD/v80/admin/en/administration/client-config/config_custom_languages. htm#Sprachk%C3%BCrzel)
- The setup will set the entered values to the application-es.yml and index-prod.yml file on fresh installations.
- For updates the dialog is not shown and the yml-files are not touched.
